DIY Distribution Box Copper Busbar

Overview

Building a busbar involves selecting appropriate conductive material (typically copper or aluminum), cutting and forming to required dimensions, drilling connection points, applying surface treatments, adding insulation, and testing for electrical performance. Let's say you have a 8kW inverter and a 48V battery: 8000W/48V = 166A Your busbar needs to be able to handle 166 Amps of current. We should multiply this by the safety factor of 125%. Material Selection. This video shows the entire process of making a distribution box using copper busbars. All electrical components shown in the video. Building a DIY power distribution box requires assembling a central electrical hub—incorporating a main breaker, branch circuits, and busbars within a NEMA-rated enclosure—to safely divide a high-capacity power source into multiple protected outlets. Youtube has a lot of clips on how to do this, usually involving a vice or hammer.
