Acceptance testing of newly commissioned relay protection

Overview

A comprehensive testing program should simulate fault and normal operating conditions of the relay. Acceptance testing, commissioning, and startup will include control power tests, current transformer and potential transformer tests, and any other device testing associated with. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards. Since the basic function of a protection relay is to correctly function under abnormal. Generally protective equipment testing may be divided into three stages: Factory tests. Periodical. For newly installed equipment, it is important for NETA Certified Technicians to critically verify that all aspects of the equipment work as intended to ensure proper and reliable operation of the electrical system. Tests on each product received.
