

Are cable trays always required to be bridging

Overview

All metallic cable trays must be grounded as outlined in NEC Article 250.96, even if the tray isn't being used as an equipment grounding conductor (EGC).

Key Takeaways

Cable trays generally require bridging for grounding and conductive continuity, but the method depends on the tray material and installation standards.

Purpose of Bridging

Bridging in cable trays is primarily used to ensure electrical continuity and proper grounding across sections of metallic trays. This helps prevent potential differences between tray sections, reduces the risk of electrical shock, and allows the tray to serve as an equipment grounding conductor (EGC) if compliant with NEC requirements. Bridging also maintains structural integrity in some installations, though its main function is electrical safety.

Material-

Specific Guidelines

Galvanized Steel Trays: Bridging can be achieved using anti-loosening nuts or washers on connecting bolts to ensure a conductive connection between tray sections. **Stainless Steel and Aluminum Alloy Trays:** These require dedicated grounding bolt holes for bridging, rather than relying on standard connection plates. **Connection Practices:** For metallic trays, connectors should use at least two sets of galvanized steel bolts with anti-loosening gaskets or insulated multi-strand copper wires with crimped tinned copper connectors.

The copper wire cross-section should be greater than 4.0 mm² to ensure proper conductivity.

NEC Compliance

According to NEC Article 392, metallic cable trays can serve as grounding conductors if properly installed. Bridging ensures that all tray sections are electrically continuous, which is critical for safety and compliance. Nonmetallic trays, such as fiberglass or plastic, do not require bridging because they are not conductive.

Practical Recommendations

Always follow the manufacturer's instructions for bridging and grounding. Use anti-loosening hardware to maintain reliable connections over time. Ensure that bridging does not interfere with cable installation or violate minimum bend radii.

For stainless steel or aluminum trays, use special grounding bolt holes rather than standard connection plates to achieve proper grounding. In summary, bridging is necessary for metallic cable trays to maintain electrical continuity and grounding, but the exact method depends on the tray material and installation standards. Nonmetallic trays do not require bridging.

Proper bridging ensures safety, compliance with NEC Article 392, and reliable operation of the electrical system.

Cable Tray Installation Rules (NEC 392) – Electrical Trader

All metallic cable trays must be grounded as outlined in NEC Article 250.96, even if the tray isn't being used as an equipment grounding conductor (EGC). This precaution helps prevent

100+ Essential Questions Answered About Cable Trays: Design ...

Discover over 100 expert answers about cable trays, covering key topics like material selection, load capacity, installation methods, and maintenance.

NEC Article 392 Requirements for Cable Tray Systems

Cable tray systems are not permitted in hoistways (elevator shafts) or in locations where they would be subject to severe physical damage. The hoistway restriction exists because moving

B-Line series Cable Tray Design Considerations

However, if cable tray is not properly designed to be compatible with its application and environment, electrical system failures can occur. This could cost millions of dollars in downtime and cause serious

Practices for grounding and bonding of cable trays

Cable tray may be used as the Equipment Grounding Conductor (EGC) in any installation where qualified persons will service the installed cable tray system. There is no restriction as to where the

Cable Tray Technical Guide A practical guide to product selection and ...

Cable tray is considered to be a system. It must provide continuous support for cables, and the electrical continuity of the cable tray system must be maintained.

Cable tray manual

Instead of large conduits, cable channel may be used very effectively to support cable drops from the cable tray run to the equipment or device being serviced and is ideal for cable tray runs involving a

Grounding & Bonding Wire Mesh Cable Trays

Learn grounding and bonding requirements for wire mesh cable tray systems. Stay NEC compliant while safely installing power, control, Ethernet, and fiber...

NEC Standards for Cable Trays: Grounding, Fill Capacity

Key Takeaways NEC Article 392 governs cable tray systems. Only approved tray-rated cables should be installed. Grounding and bonding are mandatory for metallic trays. Tray fill limits

100+ Essential Questions Answered About Cable Trays:

Cable trays, as an important component of modern building electrical systems, play a crucial role in supporting and protecting cable lines, ensuring

CABLE TRAYS GENERAL INFORMATION AND INSTALLATION

Cable tray systems are to be installed so they are accessible. If possible 300mm minimum should be left above or between installed systems to allow for cable installation and maintenance. There should be
