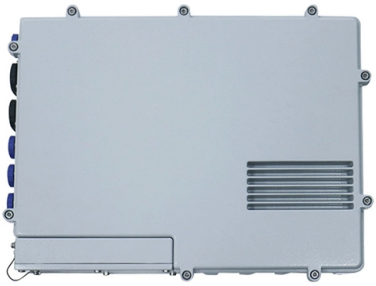
How to find the IP address of an industrial switch



Overview

Assuming the switch has had its IP configured on the subnet your test computer is on, run a subnet scan with an IP scanner and look for its MAC address.

Key Takeaways

To find the IP address of a switch on an industrial network, you can use network scanning tools, check MAC address tables, or access the switch's management interface directly.

Methods to Find the IP Address

Use Network Scanning Tools: Nmap: You can perform a subnet scan using Nmap to discover devices on your network. For example, run the command sudo nmap -sn 192. 168.x.

0/24, replacing 192. 168.x with your subnet. This will list all devices, including switches, and their IP addresses.

Angry I

P Scanner: This tool can scan your network and display connected devices, including switches, if they are on the same subnet.

Check MA

C Address Tables: If you have access to a router or another switch, you can use the command show arp to find the MAC addresses of connected devices. Then, use the MAC address to look up the corresponding IP address in the switch's MAC address table. For Cisco switches, you can connect via console or SSH and use the command show mac address-table to see which MAC addresses are associated with which ports.

Direct Console Access: If you have physical access to the switch, connect to its console port using a console cable and a terminal emulator (like PuTTY). Once connected, enter privileged EXEC mode and use the command show ip interface brief to display the IP addresses configured on the switch. Using CDP/LLDP: If you have another Cisco device on the same network, you can use Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) to discover the IP address of the switch.

This can provide information about the switch and its management IP.

Additional Tips

Ensure that your computer is on the same subnet as the switch to successfully discover its IP address. If the switch is not responding, it may not have an IP address configured or may be on a different VLAN. In such cases, check the switch's documentation for default IP addresses or reset it to factory settings if necessary.

By following these methods, you should be able to locate the IP address of a switch on your industrial network effectively.
