

Automated System for Tail Fiber Processing

Overview

Our Automated Fiber and Tape Placement machines are designed for flexibility, ease of use, and scale. Choose your configuration.

Key Takeaways

Automated control systems for tail fiber processing enable precise, efficient, and repeatable handling of fibers, whether in composite manufacturing or seafood processing, improving quality, throughput, and safety. Fiber Placement in Manufacturing

Automated Fiber Placement (AFP) and Automated Tape Laying (ATL) systems are widely used in industries like aerospace and composites to handle fibers with high precision. These systems can place multiple fiber tows simultaneously, each individually controlled for feeding, clamping, cutting, and restarting, allowing complex geometries and tight radii to be covered efficiently. Advanced AFP machines can integrate sensor-based heating, laser units, and multi-material capabilities to optimize structural performance and reduce material waste. Dual-head configurations allow simultaneous work on multiple molds, maximizing throughput while enabling manual inspection on one mold. These systems are supported by process simulation software for design validation and manufacturability assessments before production.

Automation in Seafood Tail Fiber Processing

In the seafood industry, automated control systems have been developed for humane and efficient tailing of crustaceans like nephrops. The integrated Stun and Tail System combines controlled electrical stunning with automated tailing in a continuous process, reducing manual labor, improving product quality, and enhancing animal welfare . The system allows faster processing onboard vessels, minimizes damage to the product, and improves crew working conditions by automating repetitive tasks that were previously performed manually .

Key Benefits of Automated Tail Fiber Processing

- Precision and Consistency: Automated systems ensure repeatable placement or cutting of fibers, whether in composite materials or biological tails .
- Efficiency and Throughput: Multi-tow or multi-head configurations increase production speed and reduce downtime .
- Material and Product Quality: Sensor integration and controlled processing reduce waste and improve structural or product integrity .
- Safety and Ergonomics: Automation reduces manual handling, protecting workers from repetitive strain or hazardous conditions .
- Flexibility: Systems can handle various materials, geometries, and production scales, from R&D to serial production .

Applications

- Aerospace and Composites: Wing skins, fuselage panels, and other large-scale composite structures benefit from AFP/ATL systems .
- Seafood Processing: Onboard vessels, automated tailing systems improve speed, hygiene, and animal welfare for crustaceans .
- Industrial Fiber Manufacturing: Carbon, nylon, polyester, and other fibers can be processed with custom automation solutions to optimize production lines . Automated control systems for tail fiber processing represent a convergence of robotics, sensor technology, and process engineering, enabling industries to achieve higher precision, efficiency, and safety while maintaining product quality.

Frequently Asked Questions

What is the difference between AFP and ATL?

AFP involves the precise placement of continuous fibers onto a mold surface in a predetermined pattern, often in complex shapes, while ATL uses pre...

What materials can be used in AFP/ATL?

Both AFP and ATL commonly work with materials like carbon fibers, fiberglass, aramid, and thermoplastic or thermoset matrices tailored to specific...

What are the advantages of AFP/ATL over traditional manufacturing methods?

These technologies offer enhanced precision, reduced material waste, improved structural integrity, and the ability to create complex parts with op...

Are there limitations to AFP/ATL?

Challenges can include high initial equipment costs, complexities in programming intricate designs, and the need for skilled operators to ensure pr...
