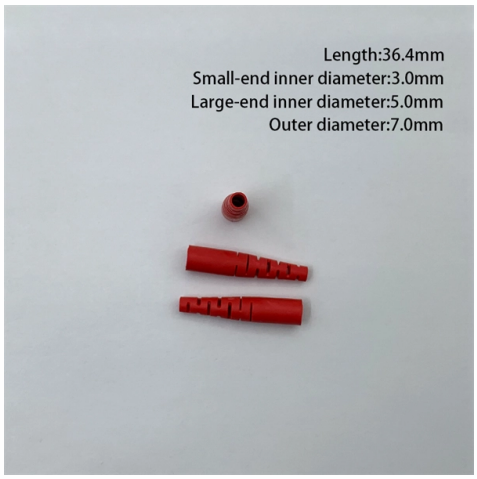
# Polishing the base of the pigtail



## Overview

Our pigtail professional covers essential repair techniques. Find your connector in thirty seconds or less ...

## Key Takeaways

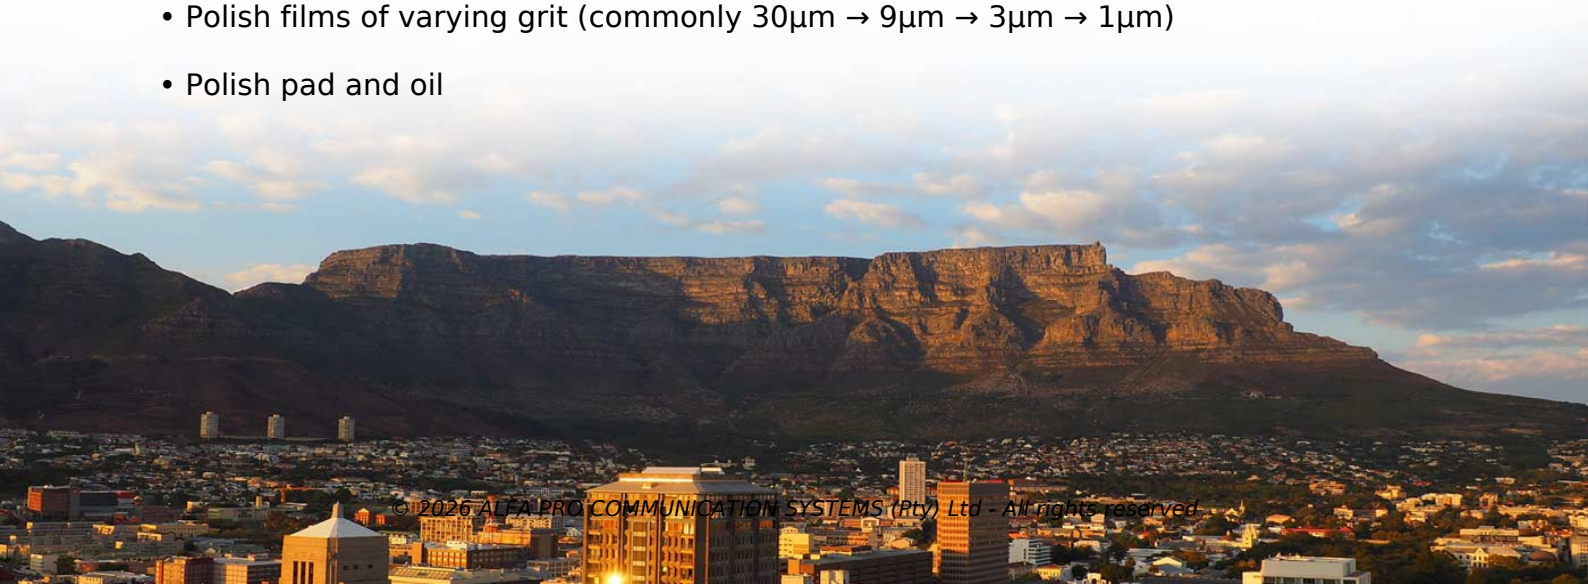
Polishing the base of a fiber optic pigtail ensures a smooth, low-loss endface for optimal optical performance.Purpose of Polishing

The bare fiber end of a pigtail must be polished to create a smooth, flat, or angled endface that minimizes insertion loss and back reflection when spliced or mated with another fiber . Proper polishing directly affects network performance, including signal quality and bit-error rates .

Tools and Materials

Essential tools and consumables include:

- Fiber cutting pen or cleaver
- Polishing machine or manual polishing jig
- Polish films of varying grit (commonly 30µm → 9µm → 3µm → 1µm)
- Polish pad and oil



© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

• Optical fiber microscope (200X–400X) for inspection

Polishing Process

• Prepare the Fiber: After cleaving, ensure the fiber is clean and free of debris. Epoxy used in adhesive/polish connectors should be cured properly to hold the fiber in place .

• Coarse Polishing: Start with a coarse grit (e.g., 30µm) to remove excess epoxy and shape the ferrule end.

• Intermediate Polishing: Progressively use finer grits (9µm, 3µm) to smooth the surface and remove scratches.

• Final Polishing: Use the finest grit (1µm) to achieve a mirror-like finish. For angled physical contact (APC) connectors, ensure the correct angle (typically 8°) is formed .

• Inspection: Examine the endface under a microscope to check for scratches, chips, or debris. Only a clean, defect-free surface ensures low insertion loss and high return loss .

Best Practices

• Avoid Over-Polishing: Excessive polishing can increase loss rather than improve it .

• Maintain Clean Environment: Dust or contamination can compromise the polish quality.

• Consistent Pressure and Speed: Automated polishing machines provide more uniform results than manual hand polishing .

• Connector-Specific Parameters: SC, LC, FC, ST, APC, and UPC connectors each require specific polishing techniques and cycles .

Summary

Polishing the base of a fiber optic pigtail is a critical step in achieving reliable, low-loss optical connections. Following proper procedures, using the correct tools, and inspecting the endface carefully ensures optimal network performance and long-term reliability .
