Standard 6-core optical fiber cable color code

Overview

The color of the connector body or boot tells you about the fiber type and, more importantly, the polish type.

Key Takeaways

For 6-core optical fiber cables, the standard TIA/EIA-598-C color sequence assigns the first six fibers the colors: Blue, Orange, Green, Brown, Slate (Gray), and White.Standard Fiber Color Sequence

The TIA/EIA-598-C standard defines a 12-color sequence for identifying individual fibers in multi-core cables. For cables with fewer than 12 fibers, such as a 6-core cable, the first six colors of this sequence are used:

- Blue
- Orange
- Green
- Brown
- Slate (Gray)

• White This sequence ensures that each fiber can be uniquely identified, reducing the risk of miswiring or splicing errors during installation or maintenance .
Application in 6-Core Cables
• Loose-tube or breakout cables: Each fiber is individually color-coded according to the sequence above.

• Connector and splice identification: The color of each fiber is used to match fibers correctly in connectors, patch panels, or splice trays.

• Scalability: If additional fibers are added later, the remaining colors in the 12-color sequence (Red, Black, Yellow, Violet, Rose, Aqua) are used sequentially .
Practical Tips
• Always verify the fiber color against the manufacturer's documentation, as some custom or hybrid cables may use alternative color schemes.

• For small-count cables like 6-core, the first six colors are sufficient, and no stripe or additional marking is needed.

• Using the standard color sequence simplifies troubleshooting and ensures compatibility with larger multi-fiber systems . By following this standardized color coding, technicians can quickly identify and manage fibers in 6-core optical cables, ensuring accurate splicing, termination, and network reliability.
