Traffic signal light cable

Overview

Traffic Signal Traffic cables manufactured for signaling, control, communications and detection in a Traffic Signal System.

Key Takeaways

Traffic signal cables are specialized multicore cables designed to connect traffic lights to controllers, built for durability, environmental resistance, and compliance with standards like IMSA, BS6346, and AS/NZS 5000.1.Overview

Traffic signal cables are essential for permanent traffic light systems, urban traffic management, and pedestrian signal systems. They provide the electrical interconnection between traffic signal equipment and the controller station, coordinating the changes in lights from green to yellow to red . These cables are designed to withstand harsh environmental conditions, including underground installation, direct burial, and aerial setups .

Cable Construction
• Conductors: Typically copper, either solid (Class 1) or stranded (Class 2), bare or tinned, depending on the application .

• Insulation: Polyethylene (PE) or Polyvinyl Chloride (PVC) is commonly used, providing moisture, sunlight, and weather resistance .

• Voltage Rating: Standard ratings are 0.6/1 kV, with some IMSA specifications rated at 300V .

• Armoring: For robustness, some cables include steel wire armor, making them suitable for direct burial .

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

• Multicore Configurations: Cables come in various core sizes to accommodate multiple signal circuits, with options for reduced earth conductors .

Installation Types

• Underground Duct/Conduit: Installed through durable piping for protection against impact and moisture .

• Direct Earth Burial: Cables can be buried directly without conduit if armored .

• Aerial Installation: Supported by a messenger wire or pole-to-pole setup, often requiring additional mechanical support .

• Loop Detector Lead-In: Specialized cables connect inductive loop detectors to controllers .

Standards and Compliance

Traffic signal cables are manufactured to meet international and regional standards:

• IMSA (International Municipal Signal Association): Ensures quality, reliability, and safety for municipal traffic systems .

• BS6346: British standard for solid copper multicore cables .

• AS/NZS 5000.1: Australian/New Zealand standard for stranded copper multicore cables .

Additional Features

• Color Coding: Available to meet municipal or project-specific requirements .

• Environmental Resistance: Designed to resist moisture, UV exposure, and temperature variations .

• Custom Solutions: Some suppliers offer bespoke cable configurations for unique traffic infrastructure projects . Traffic signal cables are critical for reliable traffic management, ensuring that signals operate safely and consistently under all environmental conditions. Proper selection and installation according to local standards and project requirements are essential for long-term performance .
