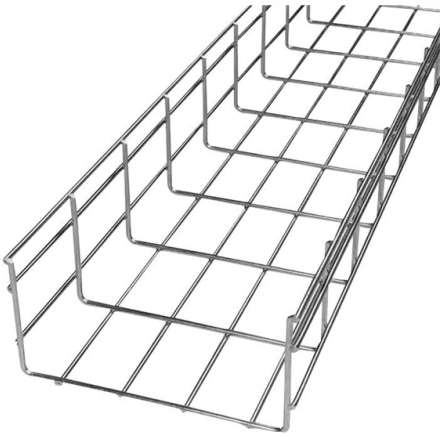
What material is the fencing around the network server rack made of



Overview

Edge Data Center Cage Fencing Our Rack Back Fall Protection mesh is mounted with brackets that fit the majority of racks. Cage & fencing accessories includ.

Key Takeaways

Server rack fencing is primarily made of steel, often in the form of welded wire mesh or solid steel panels, to ensure security, durability, and airflow.Steel as the Primary Material

Steel is the most commonly used material for high-security fencing around server racks due to its exceptional strength and resistance to cutting or tampering. It provides a robust physical barrier that protects sensitive equipment from unauthorized access while maintaining long-term durability in a data center environment .

Welded Wire Mesh Panels

Many server rack enclosures use welded wire mesh panels, where horizontal and vertical wires are welded to a tubular steel frame. This design creates a stable, impact-resistant structure that allows for maximum airflow and visibility, which is critical for cooling and monitoring . The mesh size is carefully chosen to prevent objects from passing through while still allowing ventilation.

Solid Steel Panels

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

In some cases, solid steel sheet panels are used, particularly when visual privacy or additional protection is required. These panels are heavier and can block the view of sensitive equipment, providing an extra layer of security .

Additional Features
• Impact Resistance: Panels are often tested to withstand significant force, ensuring durability against accidental or intentional impacts .

• Fire and Corrosion Resistance: Stainless steel mesh is sometimes used for its resistance to corrosion and high temperatures, which is important in environments with high humidity or potential fire hazards .

• Customizable Design: Fencing can include mesh ceilings, doors with reinforced padlock covers, and integration with shelving systems for versatile equipment placement . In summary, network server rack fencing is typically constructed from steel, either as welded wire mesh for airflow and visibility or solid steel panels for privacy and added protection. This combination ensures security, durability, and proper environmental management within the data center .
