

Can fiber optic cables only be lifted in a straight line

Overview

Fiber is stronger than steel when you pull it straight, but it breaks easily when bent too tightly. These will harm the fibers, maybe immediately, maybe not for a few years, but you will harm them and the cable must be removed and thrown away! Fiber optic cables have Kevlar aramid yarn or a fiberglass rod as their strength member. You should pull on the fiber cable strength members only! Never exceed the maximum pulling load rating. On long runs, use proper lubricants and make sure they are compatible with the cable jacket. Indoor cables can be installed in raceways, cable trays above ceilings or under. Fiber optic cables are categorized based on their deployment environment: indoor fiber optic cables and outdoor fiber optic cables. Each type is designed with specific features to ensure optimal performance under varying conditions. Indoor fiber optic cables are commonly used in buildings, offices. Real-world cable installation projects rarely involve perfectly straight cable runs. Lifting, pulling or pushing shall not be done manual.
