Which type of aerial optical cable is best

Overview

How to Choose the Right Aerial Fiber Cable This guide explains how to choose the right aerial fiber cable based on real project conditions instead of gene.

Key Takeaways

ADSS cable is generally better for long spans, harsh environments, and installations near power lines, while Figure-8 cable is more cost-effective and easier to install for shorter spans and urban telecom networks.Overview of Aerial Fiber Cables

Aerial fiber optic cables are designed for overhead deployment on poles or towers, offering faster installation and lower costs compared to underground cables. They must withstand environmental stresses such as wind, ice, UV radiation, extreme temperatures, and mechanical tension while maintaining stable optical transmission . The two most common types are:

• ADSS (All-Dielectric Self-Supporting) Cable: A self-supporting cable with no metal components, using materials like aramid yarn or glass-reinforced plastic for strength. It is lightweight, corrosion-resistant, and immune to electromagnetic interference, making it ideal for long spans, high-voltage areas, and harsh outdoor conditions . ADSS cables can support spans over 1 km and are preferred near power lines due to electrical isolation .

• Figure-8 Cable: Features an integrated steel messenger wire in a figure-eight cross-section, providing mechanical support. It is heavier, simpler to install, and more cost-effective for shorter spans (typically under 500 meters) and urban or rural telecom pole networks . However, the steel wire is prone to corrosion over time and less suitable for extreme weather or high-voltage environments.
