Overview

Bridge Engineering – Types of Bridges Bridges are classified by structure into several types: beam bridges, arch bridges, truss bridges, suspension bridges.

Key Takeaways

Bridge arch openings are classified primarily as deck arch, through arch, and tied (or mounted) arch, based on the position of the deck relative to the arch and the structural support system. 1.

Deck Arch Bridges

In a deck arch bridge, the bridge deck is positioned on top of the arch, directly supported by it. This configuration allows the arch to carry compressive forces efficiently while the deck handles traffic loads. Deck arch bridges are often considered ideal for long spans and are commonly constructed using reinforced concrete or steel.

Notable examples include the New River Gorge Bridge in West Virginia, USA, and the Wanxian Bridge in China. 2.

Through Arch Bridges

A through arch bridge has the deck located at or near the spring line of the arch, meaning the arch rises above the deck. The deck is typically suspended from the arch using vertical hangers or ties, which transfer loads into the arch. This type is also called a half-through arch bridge and is suitable for medium to long spans.

Examples include the Sydney Harbour Bridge in Australia and the Hell Gate Bridge in New York, USA. 3.

Tied or Mounted Arch Bridges

Tied arch bridges (also referred to as mounted arches) are designed so that the arch is connected to a tension tie that carries the horizontal thrust, reducing stress on the abutments. This type is often used in shorter spans or where abutment movement is expected. The design may include hinges at the base or center to accommodate thermal expansion and contraction, allowing the structure to resist internal stresses effectively.

Additional Considerations
Multi-span arches: For very long crossings, multiple arches with smaller spans are used instead of a single long arch to better handle temperature changes and reduce structural stress. **Hinged arches:** Some arches include pins or hinges at the base or crown to allow rotation and reduce bending moments caused by thermal expansion. **Material selection:** Arch bridges can be constructed from stone, reinforced concrete, steel, or composite materials, depending on span length, load requirements, and environmental conditions.

These classifications help engineers select the appropriate arch type based on span length, load distribution, site conditions, and construction materials, ensuring both structural efficiency and durability.

Bridge Engineering – Types of Bridges

Bridges are classified by structure into several types: beam bridges, arch bridges, truss bridges, suspension bridges, cable-stayed bridges, and cantilever bridges. Each type uses a distinct

Classification of bridges | PPTX

This document provides a classification of bridges based on various criteria such as material, alignment, location, purpose, superstructure type, flood hazard level, span, navigation facilities, loading, and

List of bridge types

This is a list of different types of bridges. "The five main bridge designs". ECL Civil Engineering. 21 March 2022. "Yavuz Sultan Selim Bridge, Istanbul, Turkey - Verdict Traffic".

7 Main Types Of Bridges

Arch bridges are typically constructed from stone, concrete, or steel. The arch design naturally distributes compressive forces, making these bridges incredibly strong and durable. Roman

The Basic Types of Bridges

These types of bridges are the most common forms of arch bridges, which top rises above the deck and the base remains below or at the deck. The middle segment of the deck is supported by the arch via

Chapter 17

The arch bridge is usually subject to multiple loadings (dead load, live load, temperature, etc.) which will produce bending moment stresses in the arch rib that are generally small compared with the axial

Bridge Classification Overview | PDF | Bridge | Truss

It describes different types of bridges including arch, girder, truss, and suspension bridges, as well as their materials like timber, masonry, steel, and concrete.

Types of Arches Construction based on Shape,

Types of arches based on shape, material of construction, workmanship and number of centers are discussed here. An arch is constructed in curved shape

From Roman To Modern Discover The 16 Types Of

Arches have been an integral part of architectural design for thousands of years. They are not just aesthetically pleasing but also structurally

30 Types of Arches in Architecture (with Photos and

Segmental arch roof with square glass elements and multiple spotlights. This is considered a basic type of arch, and it is used for buildings

What is Arch Bridge? Different Types of Arch Bridges

An arch is described as flexuous support spanning the gap and serving as a support for the loads on top of the opening. This definition omits an outline of what variety of structural component, an instant,

Arch bridge

An arch bridge is a bridge with abutments at each end shaped as a curved arch. Arch bridges work by transferring the weight of this bridge and its loads partially as horizontal thrust restrained by the

Arch Bridges

The arch bridges have obvious advantages in comparison with other structural types: (1) the cross-section of the arch rib is mainly subject to compression. The material properties can be fully used,

Essential Guide to Bridge Engineering: Types and Classifications

Bridge Classification by Usage According to utility, bridges can be classified into highway bridges, railway bridges, pedestrian bridges, aqueduct bridges, airport runway bridges, combined

Types of Arches: The Simplest Guide

From Roman semicircular to Gothic pointed, Tudor, Ogee, Horseshoe, Trefoil and more, explore every type of arch used in architecture with structural notes,

Types of Bridges – A Complete Guide to Bridge Structures, Materials ...

Types of Bridges- A bridge is a man-made structure built to span a physical obstacle such as a river, valley, road, or railway. It provides passage over these barriers and is a critical part

Bridge Classification Overview

The document summarizes various ways to classify bridges such as by material (e.g. timber, stone, steel), alignment (straight or skew), location (deck, through, semi-through), purpose (highway,

FHWA Bridge Inspector's Manual:

23 CFR Part 650.305 Definitions gives the definition of a bridge as it applies to the NBIS regulations: A bridge is a structure including supports erected over a depression or an obstruction, such as water,
