

Demolition of illegal structures and cutting of fiber optic cables

Optical splitter cassette type refers to the port 3.0 mm / 3.0mm clip-on fiber multichannel direct output with a plastic box packaging protection and easy to use.

Optical splitter rack mount type is using metal box packaging which can be installed in 19" frame or cabinet.

Optical splitter LCD box type is made by flame retardant material box or plate packaging. Mainly suitable for cable ports fiber box and wall mounted terminal box.

Optical splitter mini type refers to the port 0.5 mm clip-on fiber multichannel direct output with a compact design and easy to use.

Overview

Slashed fiber cables cause Central LA Spectrum internet outage Spectrum customers in West Hollywood, Beverly Hills and Koreatown lost web access after fiber.

Key Takeaways

Illegal structures under power lines and unauthorized fiber optic installations are being removed worldwide to ensure public safety, regulatory compliance, and infrastructure integrity. Demolition of Illegal Structures

Governments often target structures built in prohibited zones, particularly under high-tension power lines, due to serious safety risks. For example, the Lagos State Government in Nigeria has undertaken demolition exercises in the Makoko community and along the Third Mainland Bridge to remove shanties and buildings that encroach on high-voltage areas, despite repeated warnings to residents and community engagement efforts to relocate them. Similarly, the Anambra State Government demolished unsafe structures at Mgbuka Obosi Market, emphasizing that enforcement protects lives, reduces disaster risk, and ensures public order, with offenders facing fines or court action. These operations are typically coordinated by urban planning or safety agencies and are carried out with legal backing to prevent accidents and maintain infrastructure integrity.

Removal of Unauthorized Fiber Optic Cables

Unauthorized fiber optic installations pose both legal and operational risks. In Uruguay, the state-owned utility UTE removed fiber optic cables installed by private companies without permission on its power lines, following complaints from the national telecommunications company Antel. Such installations can cause economic damage, create safety hazards due to proximity to electrical lines, and violate public infrastructure regulations. The removal process is supervised by government authorities, and companies involved may face sanctions.

Removal of Abandoned or Low-Voltage Cables

In commercial and institutional settings, abandoned fiber optic and network cables can accumulate over time, creating fire hazards, code violations, and operational inefficiencies. Professional cable removal involves auditing, testing, and safely dismantling unused cables to prevent disruption to active networks and ensure compliance with safety standards such as the National Electrical Code. Experienced contractors can minimize business disruption while bringing facilities up to code.

Key Considerations

- **Safety:** Both illegal structures and unauthorized cables can pose risks to life and property. High-tension lines and electrical infrastructure require careful handling.
- **Legal Compliance:** Enforcement actions are backed by law, and non-compliance can result in fines, court action, or sanctions.
- **Professional Execution:** Cable removal and demolition should be performed by trained personnel to avoid accidents, network disruption, or structural damage.
- **Community Engagement:** Authorities often engage with affected residents or businesses to provide warnings and relocation options before enforcement. Overall, the removal of illegal structures and unauthorized fiber optic installations is a critical measure to protect public safety, maintain infrastructure integrity, and enforce regulatory compliance.
