

# Example of Fiber Bragg Grating

## Overview

Fiber Bragg Gratings A chirped fiber Bragg grating is a grating where the period of the index modulation varies continuously Fiber Bragg Gratings – Precisi.

## Key Takeaways

A standard Fiber Bragg Grating (FBG) is an optical fiber segment with a periodic modulation of the refractive index that reflects a specific wavelength while transmitting others. Standard FBG Example

A typical standard FBG consists of a short length of optical fiber (e.g., 1.5 meters) where the refractive index of the core is periodically altered. This creates a narrow reflection peak at the Bragg wavelength, which can range from 650 nm to 1620 nm, with a reflectivity of around 90% and a bandwidth of 0.2 nm . The periodic structure is usually inscribed using UV laser interference or femtosecond laser techniques .

### Surface-Relief FBG Example

A surface-relief FBG is similar to a standard FBG but is physically etched into the fiber cladding. This allows it to operate at high temperatures and interact with the evanescent field of the fiber mode . These are often used in harsh environments or specialized sensing applications.

### FBG Sensor Example

FBG sensors are widely used to measure strain, temperature, or pressure. When the fiber is subjected to stress, the distance between the grating points changes, shifting the reflected wavelength. For instance, a strain sensor may detect microstrain changes by monitoring the Bragg wavelength shift using an optical interrogator . These sensors are immune to electromagnetic interference and suitable for explosive or high-voltage environments.

#### Chirped and Apodized FBGs

- Chirped FBGs: The grating period varies along the fiber, enabling dispersion compensation and pulse shaping in telecommunications .
- Apodized FBGs: The amplitude of the refractive index modulation varies to reduce side lobes in the reflection spectrum, improving signal quality . These examples illustrate the versatility of FBGs in telecommunications, sensing, and laser systems, demonstrating how the periodic structure of the fiber core can be tailored for specific optical functions .
