

Fiber optic interfaces FC and SC

Overview

LC vs SC vs FC vs ST: A Complete Fiber Optic Connector Guide Compare LC, SC, FC & ST fiber-optic connectors — size, coupling, and ideal use cases — to help.

Key Takeaways

SC connectors are push-pull, square connectors ideal for general networking, while FC connectors are screw-threaded, round connectors designed for high-precision and high-vibration environments.

S

C (Subscriber Connector) Design and Mechanism: SC connectors feature a square body with a push-pull latch mechanism, making them easy to insert and remove without twisting or threading. They use a 2.5 mm ceramic ferrule to align the fiber cores accurately.

Applications: SC connectors are widely used in FTTH (Fiber to the Home), data centers, and telecom networks. They are suitable for both single-mode and multimode fibers and perform well in medium-density panels. Advantages: Simple plug-in design with stable engagement Easy to deploy and maintain Compatible with legacy telecom hardware Good performance in structured cabling systems Considerations: SC connectors may disconnect if pulled sharply and have a larger footprint compared to miniaturized connectors like LC.

F

C (Ferrule Connector) Design and Mechanism: FC connectors have a round, metal body with a screw-threaded connection, which ensures a secure and vibration-resistant interface. The ferrule is typically 2.5 mm, similar to SC, but the threaded design prevents accidental disconnection.

Applications: FC connectors are ideal for telecom systems, optical distribution frames, long-haul networks, and high-precision environments where connection stability is critical. They are commonly used in single-mode fiber networks. **Advantages:** Highly reliable under vibration and mechanical stress. Dust-resistant and rugged design. Suitable for long-distance optical communication. Maintains stable signal with minimal insertion loss. **Considerations:** FC connectors are more sensitive to dust on the fiber end face and may require careful cleaning to avoid Fresnel reflections and signal degradation.

Key Differences Between S

C and FC	Feature	SC	FC	Body Shape	Square	Round	Locking Mechanism	Push-pull latch	Screw-threaded	Ferrule Size	2.5 mm	2.5 mm	Best Use	General networking, FTTH, data centers	High-precision, long-distance, high-vibration environments	Ease of Use	Easy to plug/unplug	Requires screwing, more secure	Density	Medium	Lower density due to larger body
----------	---------	----	----	------------	--------	-------	-------------------	-----------------	----------------	--------------	--------	--------	----------	--	--	-------------	---------------------	--------------------------------	---------	--------	----------------------------------

Summary: SC connectors are user-friendly and versatile, making them suitable for general networking and telecom applications, while FC connectors provide robust, vibration-resistant connections for critical or long-distance optical links.

Choosing between them depends on installation environment, fiber type, and mechanical stability requirements.
