

High and Low Pressure Uganda

Overview

Uganda: Today's Barometric Pressure & CitiesGet current barometric pressure readings and forecasts for cities in Uganda. Track atmospheric pressure trends.

Key Takeaways

Uganda experiences seasonal high and low atmospheric pressure influenced by the ITCZ, elevation, and local geography, with higher pressure during dry seasons and lower pressure during rainy seasons.

Current Pressure Conditions

In Kampala, the current barometric pressure is around 30.06 inHg (1,018 mb), which is considered normal and indicates stable weather conditions. Pressure readings in Uganda vary by location due to elevation and proximity to features like Lake Victoria and mountainous regions, which can create local pressure differences.

Seasonal Pressure Patterns Uganda's pressure is strongly influenced by the Intertropical Convergence Zone (ITCZ). Low pressure occurs when the ITCZ is overhead, typically during the rainy seasons from March to May and September to November, bringing increased rainfall and unstable weather. High pressure dominates when the ITCZ moves away, during the dry seasons from December to February and June to August, resulting in more stable, drier conditions.

These seasonal shifts create the characteristic wet and dry cycles across the country. **Geographic Influences** Uganda's highland terrain generally results in lower atmospheric pressure compared to sea level. Areas around Lake Victoria may experience slightly different pressure due to local heating and moisture effects, while mountains and valleys can create localized pressure variations.

Elevation also affects readings; for example, Kampala sits at 1,190 feet above sea level, which slightly reduces atmospheric pressure compared to sea level.

Implications

Weather forecasting: High pressure usually signals clear skies and stable weather, while low pressure is associated with rain and storms. Health effects: Changes in pressure can affect people with migraines, arthritis, or other weather-sensitive conditions. Outdoor activities: Normal or high pressure provides favorable conditions for activities like fishing, as fish are more active under stable pressure.

Climate Change Considerations

Climate change is making Uganda's pressure patterns less predictable, with rising temperatures potentially causing more unstable air, stronger storms, and unusual pressure swings in the future. Overall, understanding Uganda's high and low pressure patterns helps in planning activities, predicting weather, and preparing for seasonal changes.
