

How high is the third-level distribution box above the ground

Overview

Breaker boxes running a voltage of 0-150 volts must have a minimum height of at least 36 inches from the ground.

Key Takeaways

The third-level distribution box is typically installed about 1.5 meters (approximately 4.9 feet) above the ground.

In a three-level distribution system, the general arrangement consists of a main distribution box, a secondary distribution box, and a switch or third-level distribution box placed below the secondary box for final circuit control and protection. The recommended height for the third-level box is generally around 1.5 meters from the floor, which ensures it is easily accessible for operation, inspection, and maintenance while remaining safe from accidental contact or environmental hazards.

Installation Considerations

- **Accessibility:** The height allows users to read labels, operate switches, and perform maintenance without bending or stretching excessively.
- **Safety:** Keeping the box elevated prevents exposure to water, dirt, or accidental impact, especially in residential or industrial settings.
- **Compliance:** Following standards such as IEC 60364-5-52 or NEC guidelines ensures proper clearance and safe operation. For example, NEC recommends a dedicated electrical space from the floor up to 1.8 meters for panelboards.

- **Environment:** Ensure the box is installed in a dry, ventilated area with sufficient clearance around it for airflow and future inspections . By installing the third-level distribution box at approximately 1.5 meters, you achieve a balance between ergonomic access, safety, and compliance with electrical standards, making it suitable for both residential and industrial applications.
