# How to connect the terminal box via jumper cable

## Overview

Dead battery? Learn how to hook up jumper cables safely and correctly with our easy, step-by-step guide.

## Key Takeaways

Connecting a terminal box with a jumper cable involves safely bridging terminals to share power or signals, or connecting car batteries using jumper cables for a temporary power boost.Connecting Terminal Block Jumpers
• Identify the terminals: Determine which terminals need to share the same electrical point, such as multiple 24V or 0V lines in a control panel .

• Select the correct jumper: Use a manufacturer-approved jumper bar or short wire compatible with your terminal block type and rated current .

• Prepare the wires: Strip the insulation from the wire ends (typically 6–10 mm depending on the terminal type) if using a wire jumper .

• Insert the jumper: Place the jumper bar or wire into the terminal openings, ensuring it bridges the correct terminals .

• Secure the connection: Tighten screws or clamps to hold the jumper firmly. Check for a solid connection by gently tugging on the wire .

• Verify the circuit: Confirm the wiring matches the schematic and that the correct terminals are now electrically common . Tips: Avoid loose or incorrect jumpers, as they can affect multiple circuits. Always power off the panel before making changes, and use ferrules for stranded wires for cleaner connections .
Connecting Automotive Jumper Cables
• Position the vehicles: Park the donor car with a charged battery close to the car with the dead battery, ensuring the hoods are accessible .

• Safety first: Turn off both vehicles, engage parking brakes, and remove keys .

• Connect the cables:
• Attach the red clamp to the positive terminal (+) of the dead battery.

• Connect the other red clamp to the positive terminal (+) of the donor battery.

• Attach the black clamp to the negative terminal (−) of the donor battery.

• Connect the other black clamp to an unpainted metal part of the dead car's engine block, not the battery .

• Start the donor car: Let it run for about 5 minutes to charge the dead battery .

• Start the dead car: Once it starts, let it run for 15 minutes to ensure sufficient charge .

• Disconnect in reverse order: Remove the black clamp from the engine block, then the black clamp from the donor battery, followed by the red clamps .

• Drive the jumped car: Keep it running for at least 15 minutes to maintain battery charge . Tips: Always follow the correct order of connections to prevent sparks or short circuits. Avoid touching clamps together while connected to a battery. By following these steps, you can safely connect terminal block jumpers in control panels or use jumper cables to start a vehicle with a dead battery, ensuring proper electrical continuity and safety.
