

How to insert a pigtail into the fiber distributor box

Overview

How to Install Fiber Optic Pigtails (Step-by-Step Guide) Remove the outer coating carefully to expose the fiber. Use alcohol wipes to remove dust and debris.

Key Takeaways

To insert a fiber optic pigtail into a distribution box, you prepare the fiber, perform a fusion splice with the incoming cable, and secure the pigtail in the splice tray for organized routing and protection. Step 1: Prepare the Fiber and Pigtail

Begin by carefully stripping the outer coating of the fiber optic pigtail to expose the glass core. Clean the fiber with alcohol wipes to remove dust and debris, and make a precise cut for optimal splicing performance. Always use high-quality, pre-tested pigtails to minimize signal loss and installation errors .

Step 2: Open the Fiber Distribution Box

Open the fiber distribution box and locate the splice tray or cassette. These trays are designed to hold fibers securely and protect them from bending or damage. Ensure the box is clean and free of dust before inserting fibers .

Step 3: Fusion Splice the Pigtail

Align the bare end of the pigtail with the incoming fiber from the main cable. Use a fusion splicer to melt the fiber ends together, creating a continuous optical path. After splicing, apply a heat-shrink sleeve over the joint to protect it and maintain durability .

Step 4: Secure the Pigtail in the Splice Tray

Place the spliced pigtail into the splice tray, following the tray's routing channels to avoid sharp bends. Coil any excess fiber neatly within the tray to prevent stress on the splice. The connector end of the pigtail should be positioned for easy access to connect to patch cords or other equipment .

Step 5: Test the Connection

After installation, use an OTDR (Optical Time-Domain Reflectometer) or a power meter to verify the splice quality and ensure minimal signal loss. Proper testing confirms that the pigtail and main fiber are correctly aligned and functioning reliably .

Step 6: Close and Label the Box

Once all pigtails are installed and tested, close the distribution box securely. Label each pigtail and corresponding port for easy identification and future maintenance . By following these steps, you ensure a reliable, low-loss fiber connection within the distribution box, maintaining network integrity and simplifying future troubleshooting or expansion.
