

How to model BIM cable trays

Overview

Modeling and Coordinating Cable Tray Systems in Revit for Electrical. Understand how to model a cable tray using the systems tab in the electrical section.

Key Takeaways

Modeling cable trays in BIM involves using Revit or similar software to create accurate 3D representations with real-world data, incorporating manufacturer libraries, parameters, and accessories. Step 1: Prepare Your Project Environment Start by setting up your BIM project in Revit or your preferred software. Ensure that your project units, levels, and grids are correctly defined.

If you have existing CAD drawings of cable tray layouts, you can import them to use as a reference for your 3D modeling. Step 2: Use Manufacturer BIM Libraries Many manufacturers provide ready-to-use BIM objects for their cable tray systems. For example: Pensa Metatray® provides RVT and RFA files for Revit, including all necessary families for proper configuration.

T&

B Cable Tray Systems offer Revit RVT files, Intergraph Smart 3D CAD VUE files, and 3D STEP files for industrial plant modeling. Legrand Cablofil provides 3D modeling files compatible with Revit, AutoCAD, and plant design systems. Downloading these libraries ensures your model uses accurate dimensions, materials, and product data.

Step 3: Model Cable Tray Runs In Revit: Use the Cable Tray tool to create runs along walls, ceilings, or supports. Define the tray type, width, and material. Add bends, intersections, and junctions using Revit's built-in fittings.

Ensure proper connectivity between segments to maintain a continuous path. Step 4: Add Accessories and Supports Enhance your model by including: Supports and hangers Couplings and junction boxes Cable tray covers or dividers These elements are often included in manufacturer BIM libraries and can be placed automatically or manually along the tray runs. Step 5: Set Parameters and Metadata Assign parameters such as: Tray dimensions and material Load capacity Fire rating or insulation type Manufacturer and part number This ensures your BIM model is data-rich and can be used for scheduling, cost estimation, and maintenance planning.

Step 6: Documentation and Collaboration Generate schedules for cable trays, fittings, and accessories. Annotate drawings with tray sizes, routes, and elevations. Coordinate with other disciplines (MEP, structural, architectural) to avoid clashes.

Optimize the model for performance by using LOD standards appropriate for your project phase. Step 7: Optimization Tips Use CAD imports only as references; convert to native Revit elements for better performance. Keep families organized in a library for reuse.

Regularly check for clashes using BIM coordination tools. By following these steps, you can create a precise, fully coordinated BIM model of cable trays that integrates seamlessly with your MEP and architectural models, supports documentation, and facilitates project collaboration.
