

Indoor optical cable types single-mode and multi-mode

Overview

Single Mode vs. Multimode Fiber Optic Cables Discover fiber optic cable types, including single-mode (OS1, OS2) and multimode (OM1, OM3, OM4) Fiber Optic Cable Types.

Key Takeaways

Indoor optical fiber cables are commonly multi-mode, but single-mode cables are also used depending on distance and network requirements. Typical Indoor Fiber Type

Indoor fiber optic cables are often multi-mode because they are designed for short-distance, high-speed data transmission within buildings, offices, or data centers. Multi-mode fibers have a larger core diameter (50–62.5 μm), allowing multiple light modes to propagate simultaneously, which makes them ideal for short-range applications up to about 500–600 meters at high data rates. They are cost-effective, easier to install, and compatible with LED light sources commonly used in indoor networks.

Single-Mode Indoor Fiber

While less common indoors, single-mode fiber can also be used, especially when longer distances or higher bandwidth are required, such as in backbone connections between floors or buildings. Single-mode fibers have a smaller core (around 9 μm) and transmit a single light mode, minimizing signal loss and allowing data transmission over several kilometers. They typically use laser light sources and are more expensive than multi-mode fibers.

Summary of Differences for Indoor Use	Feature	Multi-Mode Fiber	Single-Mode Fiber	Core size
		50–62.5 μm	~9 μm	
	Light modes	Multiple	Single	
	Typical distance	Up to 500–600 m	Several km	
	Light source	LED	Laser	
	Cost	Lower	Higher	
	Common indoor use	Office networks, data centers	Backbone links, long indoor runs	

In conclusion, most indoor optical cables are multi-mode due to their suitability for short-range, high-speed connections and lower cost, but single-mode cables are chosen for longer indoor runs or high-performance backbone links .
