

Lightning Protection for Indoor Distribution Boxes

Overview

Distribution box surge protector: an important part of lightning protection. In areas with frequent lightning strikes, electrical equipment is easily damaged.

Key Takeaways

Yes, indoor distribution boxes can be connected to lightning protection devices, provided proper bonding, earthing, and separation distances are observed according to relevant standards.

Indoor distribution systems, such as Distribution Antenna Systems (DAS) and Digitization Distribution Systems (DDS), are used to enhance mobile communication within buildings. These systems are susceptible to lightning-induced surges and overvoltage, which can damage equipment if not properly protected. Connecting indoor distribution boxes to lightning protection devices (LPDs) or surge protection devices (SPDs) is a standard method to mitigate these risks.

Protection Principles

- **Surge Protection Devices (SPDs):** SPDs are installed at the entry points of power or signal lines into the distribution box. They divert transient overvoltages to earth, protecting downstream equipment. Type I SPDs handle direct lightning currents, Type II SPDs protect sub-distribution boards, and Type III SPDs protect end devices.
- **Bonding and Earthing:** All SPDs and lightning protection modules must be connected to a local equipotential bonding system. The earthing conductor should be as short as possible and of sufficient cross-section to minimize residual voltage and ensure effective protection.

- **Separation Distances:** For coaxial, Ethernet, or fiber cables, separation distances from external lightning protection systems and mains power lines must be maintained. If distances cannot be met, additional insulation or intermediate earthing points may be required .

- **Installation Location:** Host machines or main distribution boxes are ideally located centrally or in the basement to reduce exposure. Lightning protection boxes can be installed in parallel with the power supply lines of three-phase systems to protect communication and electrical equipment .

Practical Considerations

- **Device Compatibility:** Ensure the SPD or lightning protection box is rated for the voltage and current of the indoor distribution system. Some devices, like the TRSX-20N, are designed for high surge currents and provide automatic reset after transient events .

- **Maintenance:** Lightning protection modules often include failure indicators. Regular inspection ensures that any degraded modules are replaced promptly to maintain protection .

- **Standards Compliance:** Installations should comply with IEC 62305, IEC 60364, and ITU-T K.158 for lightning and surge protection in indoor distribution systems .

Conclusion

Indoor distribution boxes can and should be connected to lightning protection devices to safeguard sensitive communication and electrical equipment. Proper installation requires attention to earthing, bonding, separation distances, and device ratings, following international standards to ensure effective protection against lightning-induced surges and transient overvoltages .
