Metal sheath inside the optical cable

Overview

We will look into the 18 common and specialized sheath materials in this section, exploring their features, such as advantages, disadvantages, and situations for use.

Key Takeaways

The metal sheath in optical cables primarily provides mechanical protection, moisture resistance, and environmental durability, ensuring the integrity and longevity of the optical fibers.

Mechanical Protection

A metal sheath acts as a robust armor around the optical cable core, shielding the delicate glass fibers from physical damage such as crushing, bending, or impact during installation and operation. This is especially important in harsh environments like underground, underwater, or industrial settings, where cables may be exposed to heavy loads, abrasion, or rodent attacks. The sheath can be made of steel or aluminum strips, often coated with plastic for additional protection.

Moisture and Environmental Resistance

Metal sheaths prevent water or moisture from entering the cable core, which could otherwise degrade the optical fibers and impair signal transmission. Some designs, like semi-hermetic bonded aluminum or steel sheaths, provide a barrier against humidity, chemical corrosion, and environmental contaminants. In addition, oil-filled or compound-filled cores can further prevent moisture spread if the sheath is breached.

Fire Resistance and Safety

In certain applications, metal sheaths enhance fire resistance. For example, mineral-insulated cables use a solid metal sheath with magnesium oxide insulation to maintain circuit integrity at temperatures exceeding 950°C, making them suitable for fire alarm systems and emergency power circuits. This ensures that optical communication or control systems remain operational during fire events.

Additional Benefits

Rodent and pest protection: Metal sheaths can prevent damage from animals in tunnels or underground installations. Durability in extreme conditions: They provide resistance to UV radiation, chemical exposure, and mechanical stress, extending cable lifespan. Structural support: In armored cables, the metal sheath can also serve as a grounding path or contribute to overall cable rigidity.

In summary, the metal sheath in optical cables is a critical component that protects the fibers from mechanical, environmental, and thermal hazards, ensuring reliable performance in demanding installation conditions. Its design and material selection depend on the specific application, such as direct burial, overhead, or industrial use.

Article Content

28 Selection_of_the_Correct_Optical_Cable

Bonding is the connection of all metallic components in the cable sheath together (metallic armor and metallic central strength members) to keep them at the same potential and ensure electrical

Composition of communication optical cable

The sheath commonly used for optical cables is a semi-hermetic bonded sheath. It consists of double-sided plastic-coated aluminum strips (PAP) or steel strips (PSP) longitudinally

18 Cable Sheath Materials Explained

We will look into the 18 common and specialized sheath materials in this section, exploring their features, such as advantages, disadvantages, and situations for use.

Metallic Armoured Multi-Tube Fiber Optic Cable

Gel filled multi loose tube cable with metallic armour of steel wires crown and double jacket for indoor / outdoor installation. The metallic armour provides an effective

What Are the Raw Materials of Fiber Optic Cables? Full Guide

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

A complete guide to the raw materials of fiber optic cables—optical fibers, PBT tubes, FRP rods, aramid yarn, steel armoring, HDPE/LSZH jackets, and more. Compare ADSS, OPGW,

Analysis Of Optical Cable Sheath Materials: All-round

The sheath or outer sheath is the outermost protective layer in the optical cable structure, mainly made of PE sheath material and PVC sheath material, and

Cable Inner Sheath: Materials, Functions & Applications

The inner sheath in cable is an intermediate protective layer between the internal structure and the outer sheath. It is usually made from materials such as

Introduction To Armored Optical Cable

An armored optical cable is a special optical cable with a protective stainless steel armor tube wrapped around the fiber core. The metal armor layer effectively protects the fiber core from

Fiber-optic cable

Optical fiber consists of a core and a cladding layer, selected for total internal reflection due to the difference in the refractive index between the two. In practical fibers, the cladding is usually coated

Application Notes

Except for the most severe Outside Plant conditions, a single jacket, either metallic or dielectric armored cable will likely provide sufficient protection to the cable required for it to provide satisfactory

Cable Bending Radius: IEC Standard, Formula

Cable bending radius is one of the most important factors in electrical installation, cable management, and long-term system reliability. Whether you

Outdoor FTTH Drop Fiber Cable, Self-Supporting

FTTH outdoor drop cable (GJYXFCH/GJYXCH) is also called self-supporting butterfly drop optical cable which consists of a indoor butterfly cable and an

NEC 300.22: Wiring in Ducts, Plenums, and Air Spaces

Type MC cable: Must have a smooth or corrugated impervious metal sheath with no nonmetallic outer covering. Interlocking-type MC cable is not permitted because the gaps in its armor

Demystifying Drop Cables: Understanding Their Types

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

Flat drop cable is known for its flat appearance and is usually made of a polyethylene (PE) sheath, a loose tube with the optical fiber inside, and two FRP reinforcements to provide high

Fiber Optic Cable Components & Materials: Complete

Explore the 5 key fiber optic cable components and materials used in modern networks. Learn how glass, coatings, and strength members affect

Basic Components of a Fiber Optic Cable

This article examines the key components that make up a fiber optic cable including the core, cladding, coating, strengthening fibers and cable jacket.

18 Cable Sheath Materials Explained

Discover 18 types of cable sheath materials. Full comparison of fire resistance, flexibility, environmental tolerance, and usage in telecom, power, and automation cables.

6 Fiber Cable Outer Sheath Materials and How To Choose?

Requirements So the material of the fiber optic cable outer sheath must be able to withstand the sun and rain, and not crack due to ultraviolet radiation. At the same time, it must have
