

Minimum distance from construction distribution boxes

Overview

Electrical Clearances: Requirements and Safe Distances Electrical clearances are the minimum separation distances the National Electrical Code (NEC) require.

Key Takeaways

Construction distribution boxes should be installed with a vertical clearance of 1.3-1.5 meters for fixed boxes and 0.

6-1.5 meters for mobile boxes, with sufficient surrounding space for maintenance and safety. Vertical Clearance from Ground Fixed distribution boxes: The bottom surface should be at least 1.

3 meters and no more than 1.5 meters above the ground to ensure accessibility and safety. Mobile distribution boxes: The bottom surface should be at least 0.

6 meters and no more than 1.5 meters above the ground. This height range helps prevent accidental contact, allows safe operation, and keeps the boxes out of reach of unauthorized personnel or children in certain areas.

Horizontal and Equipment Spacing

The distance between the main distribution box and switch boxes should not exceed 30 meters. The horizontal distance between a switch box and the fixed electrical equipment it controls should not exceed 3 meters. Adequate spacing around the box is required for ventilation, heat dissipation, and maintenance, allowing at least two people to work safely at the same time.

Safety and Environmental Considerations

Distribution boxes should be installed in dry, ventilated areas and away from gas, steam, liquids, vibration, or heat sources. No items should be stacked around the box that could obstruct access or maintenance. Boxes should be made of iron plate or high-quality insulating material, with proper grounding and insulation to prevent electrical hazards.

Live parts must be guarded according to OSHA or local electrical safety regulations, ensuring that the dedicated space around the box is free from pedestrian or vehicular interference.

Summary

For construction sites, the minimum vertical distance from the ground is 1.3 meters for fixed boxes and 0.6 meters for mobile boxes, with horizontal spacing of up to 30 meters between main and switch boxes and 3 meters between switch boxes and controlled equipment.

Proper installation also requires ventilation, protection from environmental hazards, and safe access for maintenance to comply with safety standards and prevent accidents.
