Multimode fiber optic composite cable

Overview

Multimode fiber is categorized by OM (Optical Multimode) designations, defined by the ISO/IEC 11801 standard., 100BASE-FX), older office. Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections (up to 550m). Single mode fiber optic cable is made up of a small diameter glass or plastic core surrounded by cladding, which is a layer of reflective material. This small diameter core, typically around 9 microns in diameter, allows only one mode of light to pass through, resulting in a narrower beam of light. Multimode fiber (MMF) is an optical fiber designed to carry multiple light propagation paths—or modes—simultaneously. This is made possible by its relatively large core diameter, typically 50 or 62. 5 microns, compared to the ~9-micron core in single-mode fiber. We supply high quality hybrid cable and composite fiber cable to integrate all of your wiring needs for different applications based in common locations. 100% end-face, 3D interferometer, IL&RL tested.
