

# Multimode optical fibers with different cores can be fused together

## Overview

It is possible to splice two optical fibers with different core sizes by fiber fusion splicer, but you need to be careful. Multimode fiber (MMF) has a wider core, usually 50 or 62. It carries several light paths and is used for short distances, like inside offices or data centers. Fusion splicing is the most widely used method of splicing as it provides for the lowest loss and least reflectance, as well as providing the strongest and most reliable joint between two fibers. A fiber optic pigtail is a fiber optic cable with one end terminated with a factory-installed connector and the other end unterminated. As a result, the connector side can be connected to equipment, while the other side is fused in the case of fusion splicing and a mechanical connection in the case. The fusion method fuses the fiber cores together with less attenuation. Let's explore the fundamentals of mechanical and fusion.
