

Requirements for the thickness of the optical cable sheath

Overview

The mechanical and environmental performance of the cable are in accordance with the following table.

Key Takeaways

The outer sheath of an optical fiber cable typically ranges from 0.5 mm to several millimeters, depending on the cable type and environmental requirements. Sheath Function and Structure

The optical cable sheath serves as the primary protective layer for the delicate fiber core, shielding it from mechanical damage, moisture, and environmental hazards . It is usually made from durable plastics such as polyethylene or PVC, providing flexibility and resistance to abrasion, chemicals, and UV exposure . The sheath also helps maintain the cable's structural integrity during installation and operation.

Typical Thickness

- Individual fiber coating: Each optical fiber is first coated with a thin protective layer, typically 250-900 microns (0.25-0.9 mm), which cushions the fiber and prevents microbending .
- Buffer or core tube layer: Around the coated fibers, a buffer or core tube may be applied, adding 0.5-2 mm of thickness depending on the design.

- **Outer sheath/jacket:** The final outer sheath, which is the main protective layer, generally ranges from 1 mm to 5 mm for standard indoor or outdoor cables. For specialized armored or outdoor cables, the sheath can be thicker to withstand harsh conditions .

Factors Affecting Sheath Thickness

- **Cable type:** Single-mode, multimode, or bend-insensitive fibers may have slightly different sheath requirements.
- **Environmental conditions:** Outdoor, direct-burial, or aerial cables often require thicker or reinforced sheaths.
- **Mechanical protection:** Cables exposed to high stress, crushing, or rodent activity may include additional layers or armoring, increasing overall thickness .

Summary

The optical cable sheath thickness is not fixed but is designed to balance protection, flexibility, and installation ease. Standard outer jackets typically range from 1 mm to 5 mm, while the inner fiber coatings are much thinner, around 0.25–0.9 mm. Specialized applications may require thicker or armored sheaths to ensure long-term durability and performance .
