

Router fiber optic interfaces are prone to breakage

Overview

Aging: Over time, fiber optic cables can suffer from static fatigue, leading to natural fiber breakage. Intentional Destruction: Deliberate acts of vandalism or theft. Fiber-optic cables are the backbone of modern connectivity—powering 5G networks, global internet backbones, and data center interconnections with near-light-speed data transmission. While these cables are engineered for durability (with some rated to last 25+ years), they are not invulnerable. Environmental factors, such as exposure to water, extreme temperatures, or chemicals, can damage the. How easy it might be to break a fiber optic cable depends on its protection level. It is true that each fiber is very fragile. And without a protective barrier, the risk of breaking is quite high. Such damages can be partial or complete, but they are often difficult to locate and. Yea those super thin ones barely have any kevlar fibers in them so they're much more prone to breaking.
