A distribution boxes is an essential device that manages the safe and efficient flow of electrical power throughout different areas of a building or facility. It is commonly used in homes, offices, and industrial settings to control and protect electrical circuits. A. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. The ring switch (b) at RMU B has been intentionally left open to provide the system with an 'open point'.

North American distribution boards are generally housed in sheet metal enclosures, with the circuit breakers positioned in two columns operable from the front. Some panelboards are provided with a door covering the breaker switch handles, but all are constructed with a dead front; that is to say the front of the enclosure (whether it has a door or not) prevents the operator of the circuit breakers from contacting live electrical parts within. Busbars carry the current from incoming line (hot) conductors to the breakers
