

Which trademark category does cable tray belong to

Overview

If the goods and services in your application are based on “use in commerce,” you must be using the trademark in commerce for all the goods and services listed in your application.

Key Takeaways

Cable trays are typically classified under Class 9 for electrical and scientific apparatus.

Explanation

Cable trays are physical products used to support and organize electrical cables in industrial, commercial, and residential installations. In trademark law, products are categorized into one of 45 classes to organize goods and services for registration purposes. Class 9 covers electrical and scientific apparatus, including devices and equipment for conducting, distributing, or controlling electricity.

Examples include electrical wires, cables, switches, and related hardware. Since cable trays are used to support and route electrical conductors, they fall under this category.

Additional Considerations

If a cable tray is part of a larger system or installation, it may also be relevant to consider Class 6, which covers metal hardware and building materials, if the tray is primarily a structural metal component. For international trademark registration, the Nice Classification system aligns similarly, placing electrical distribution and support equipment under Class 9. When filing a trademark, it is important to describe the goods accurately, e.g., "metal cable trays for electrical wiring," to ensure proper coverage and avoid conflicts.

In summary, for trademark purposes, cable trays are generally registered under Class 9, which encompasses electrical apparatus and related equipment, though the material composition or specific use may influence secondary classifications.
